Privacy Policy

Last Updated: November 14, 2026

This Privacy Policy describes how FOP Tkach Oleksandr ("we," "us," or "our") collects, uses, and protects your information when you use the unified TUWA ecosystem, which includes the main site tuwa.io, the showcase at demo.tuwa.io, the Quasar dashboard at quasar.tuwa.io, the Custom Styles editor at custom-style.tuwa.io, the documentation at docs.tuwa.io and stories.tuwa.io, and our open-source npm packages (Orbit Utils, SIWX, Satellite Connect, Pulsar, Nova UI Kit, the TUWA SDK and the Quasar SDK).

1. Open Source Ecosystem & Transparency

The core logical layers of TUWA are open-source and publicly available on GitHub. Our npm packages (`@tuwaio/orbit-*`, `@tuwaio/satellite-*`, `@tuwaio/pulsar-*`, `@tuwaio/nova-*`, `@tuwaio/siwx-*`, `@tuwaio/sdk` and the network add-ons) run in your own app and send no data to us. Quasar Community Edition runs on your own servers and sends no data to us either. We encourage you to review our Documentation to fully understand how data flows within these headless and UI-agnostic modules.

2. Core Principle: Self-Custody

TUWA is built for self-custody and keeps data on your device where it can. We NEVER ask for, access, or store your private keys. You maintain full sovereignty over your digital assets at all times.

3. Data Collection & Usage

To provide the ecosystem's features, we collect limited, specific data:

- **Registration & Notifications:** We collect your email address strictly for authentication, account management, and sending necessary operational notifications.
- **Wallet Sign-In:** If you sign in to the Quasar dashboard with a wallet (SIWX), we store its public address to identify your account.
- **Web3 Synchronization:** We collect public wallet addresses and transaction metadata to synchronize your on-chain history across devices via the Quasar cloud layer.
- **Billing Information:** Quasar Cloud is in public beta and free of charge, so we do not collect billing or payment details.

We do not sell your personal data to third parties.

4. API Keys & Infrastructure

We utilize robust RPC infrastructure to process blockchain requests. Organizations can provide their own provider settings for their apps: custom RPC endpoints, Alchemy or QuickNode keys, and Pimlico keys. Quasar Cloud reads the transactions of an organization's apps only through the RPC providers that the organization sets up, and tracks sponsored (ERC-4337) transactions only with the app's own Pimlico key or bundler URL. Any custom RPC endpoints and API keys you provide are encrypted at rest in our database (AES-256-GCM) and decrypted only by the Quasar engine when it calls your provider. When you provide them, the Quasar engine sends that provider the data its request needs, such as a transaction hash or a wallet address, under your own agreement with the provider.

5. Data Storage and Protection

Most Web3 operations occur locally on your client device using Local Storage (for example, by Pulsar and Satellite Connect). Any data transmitted to Quasar Cloud is protected using industry-standard security measures, including transport layer security (TLS) and access controls that scope every record to its organization.

6. Your Privacy Rights

You may request access to and correction or deletion of personal data associated with your account, subject to applicable law, including legal retention obligations and exceptions (Regulation (EU) 2016/679, Articles 15 and 17). Where the law gives you these rights, you may also ask us to restrict or stop processing, object to processing based on our legitimate interests, and receive your data in a portable format. To exercise these rights, please contact us at admin@tuwa.io. Immutable on-chain data cannot be deleted by us.

7. Additional Privacy Information

For personal data within the scope of applicable data-protection law, this section gives our purposes and legal bases, retention periods, recipients and international transfers, and how to complain to a supervisory authority (Regulation (EU) 2016/679, Articles 13 and 14).

Controller and contact. FOP Tkach Oleksandr, Ukraine, admin@tuwa.io. We have not appointed a data protection officer; write to the same address with any data protection question.

Purposes and legal bases.

Activity	Data	Legal basis
Your Quasar account: sign-up, sign-in, two-factor authentication, passkeys, linked wallets, your profile	Email address, password hash, 2FA and passkey data, public wallet addresses; the name and the Telegram and Discord usernames you choose to add to your profile	Performance of our contract with you

Activity	Data	Legal basis
Keeping accounts and services secure: sessions, rate limits, abuse prevention, blocking re-registration of a deleted email for 30 days	Session tokens, with the browser and operating system each session was used from, the country it was last used from (as Cloudflare reports it, without the IP address) and when it was last active, to show you the devices your account is signed in on and let you end their sessions; IP addresses, to limit requests and sign-in attempts, in the email that tells the owners of an organization about its export, and in the server log of a refused request to an app that accepts only listed IP addresses; email address of a deleted account	Our legitimate interest in secure services and in preventing abuse
Managing the access of teams: who lost access to an organization and who deleted one, to investigate incidents and disputes about that access	Email address of a removed member, the account that deleted an organization, the dates	Our legitimate interest, and the organization's, in managing access to its organization and in investigating incidents and disputes
Complying with sanctions: checking an organization or person reported to us as subject to sanctions	Names, email addresses, wallet addresses and organization details of the case, the lists checked and the result	Our legal obligations under sanctions law, and our legitimate interest in complying with it
Providing Quasar Cloud to your organization: apps, API keys, webhook endpoints, usage and quota	Names and settings of your organization and apps, usage records, the log of the API requests of each app (the method, the path, the status, the duration and the error code of each, without bodies, headers or keys), the members of the organization and their roles	Performance of our contract where you are the party to it (for example, as a sole proprietor); otherwise our legitimate interest, and your organization's, in providing and using the service your organization signed up for
Operational emails: verification, security notices, quota notices	Email address	Performance of our contract with you

Activity	Data	Legal basis
Recording agreements: who accepted the Terms of Service and the Data Processing Addendum, or signed the standard contractual clauses, for which organization and with what authority, which versions and when; the emails that told the owners of an organization about a new version of a document	Name and email address of the person, their role in the organization; the details of the organization as given, including the name, position and email address of its contact person; the confirmations as shown, the versions and the time; for the standard contractual clauses, also the answers about the organization's data flow, the package both parties signed and the evidence copy that records the signatures; where the organization's flow matches the standard flow profile of our transfer assessment, the record of the match (the conditions it meets, the versions of the documents and the time) and what our system checked for the package before we signed it through our standing offer; for each notice, the owner's email address and when it was sent; where the organization processes the data for a controller, the email address it gives for that controller's notices of changes of the Data Processing Addendum that concern it, the copies we send there and whether they were delivered. We do not record IP addresses	Performance of our contract with the account holder or the organization; for a person who accepts or signs on behalf of an organization and for its contact person, our legitimate interest, and the organization's, in proving who concluded the agreement, with what authority and on what terms, and that the owners were told about a new version
Finding and fixing errors of the Quasar dashboard and engine	Technical error details in the logs of our own servers, including errors that the pages of the Quasar dashboard report from your browser: the error and where it happened, and the path of the page without its query. The error reports that our alerts read (one JSON line per failure) leave out email addresses, wallet addresses, IP addresses, keys and the parameters of database queries; every other log line of our services, other error lines included, can contain details of the operation that failed, such as a wallet address or an email address (see "Server logs" below)	Our legitimate interest in reliable services
Answering requests and legal claims	Your messages and the data needed to answer them	Our legitimate interests and legal obligations

Our role for your apps. When an organization syncs its users' transactions to Quasar Cloud, that organization decides what is processed and is the controller of that data. We process it on the organization's behalf under our Data Processing Addendum. Its users should contact the organization first; we will help it answer.

Retention.

- Account data: until you delete your account. After deletion, we keep the email address for 30 days to block re-registration and then remove it from the account; the records of accepting our terms keep it as described below.
- Records of removed members and deleted organizations: 12 months after the removal or deletion.
- Records of sanctions checks: 5 years after the case is closed, unless the law requires a different period.
- Records of accepting our Terms of Service and the Data Processing Addendum, of our checks of who may act for an organization (including a suspension of its intake during a check), and of the emails telling owners about a new version: while the account (for the records of signing up) or the organization exists, and 3 years after it is deleted, as evidence for claims under the agreement.
- The standard contractual clauses: the signed package (the text of the clauses with their annexes, including the details of the organization and its contact person), the evidence copy that names who signed and when, and the records of each signature and of our decisions on the organization's answers, including the record of a match with the standard flow profile, are kept while the organization exists and 3 years after it is deleted, as evidence that the clauses were concluded and on what terms. When the organization is deleted, we remove the name and email address of the person who signed and the details of the contact person from the record of the organization's signature; they then remain only in the signed package and the evidence copy, which cannot be changed without losing their value as evidence.
- Transactions and webhook endpoints: while the app that sent them exists; they are deleted together with the app or its organization.
- Webhook delivery logs: up to 3 months, and together with the app or its organization if that is earlier. Where the organization's clauses rest on the standard flow profile, they keep only the status of each response, not its content.
- API request logs: the newest 1,000 requests of each app, up to 7 days.

- Our standing offer for the standard flow profile: the record of it holds the name and email address of our signatory, the time, the versions of the documents and the conditions of the offer. It is kept while any clauses signed through it are kept, and 3 years after the last of them is deleted, as evidence for all of them; deleting one organization does not delete it.
- Server logs: the log of our reverse proxy records each request without your IP address and is deleted after 7 days. The logs of our services record their events and errors, including the identifiers of the transactions they process, details of an operation that failed (which can include a wallet address or an email address) and, for a request refused to an app that accepts only listed IP addresses, the IP address it came from; our log system keeps them for 7 days, and each server keeps only the latest 30 MB of each service's log, which newer entries replace.
- IP addresses used to limit requests and sign-in attempts: up to 5 minutes.
- The browser, operating system, country and last activity of a session: while the session lasts, at most 7 days.
- Backups: deleted data can remain in our encrypted database backups for up to 8 days.

Recipients and processors. We share personal data only with providers that help us run the ecosystem, and only the data each one needs:

- HostHatch: the servers of Quasar Cloud (production and staging) in Amsterdam, the Netherlands.
- Cloudflare: network, security and DNS for every site; storage of backups and files (R2).
- Vercel: hosting of tuwa.io, the documentation sites, demo.tuwa.io, custom-style.tuwa.io and stories.tuwa.io.
- Resend: delivery of emails.
- Alchemy: blockchain reads of the Quasar dashboard, such as the ENS name of the wallet you connect.
- UptimeRobot (UptimeRobot s.r.o., Slovakia): monitoring the availability of our sites and services from its own servers. It receives no data about you: our status page at tuwa.io/status reads its results on the tuwa.io server, and your browser does not contact UptimeRobot.

Providers that an organization sets up for its apps, such as its own RPC endpoint or its Alchemy, QuickNode or Pimlico key, receive data on that organization's instruction and under its own agreement with them (Section 4). We may also disclose data

where the law requires it.

International transfers. We are established in Ukraine and collect your data directly from you. The Quasar Cloud servers are in the Netherlands. Several providers above are established or process data in the United States or in other countries outside the European Economic Area. Where the GDPR requires a safeguard for such a transfer, these are the safeguards in the providers' terms:

- Cloudflare, Vercel and Resend: their certification under the EU-U.S. Data Privacy Framework.
- HostHatch: the standard contractual clauses in its data processing addendum, for any access to our servers from outside the European Economic Area.
- Alchemy: the standard contractual clauses in its data processing addendum.

You can ask us at admin@tuwa.io which safeguard applies to a particular provider.

Complaints. If the GDPR applies to you, you may complain to the data protection supervisory authority of the EU or EEA country where you live or work or where you believe an infringement took place. Separately, compliance with Ukrainian data protection law is supervised by the Ukrainian Parliament Commissioner for Human Rights. We would appreciate the chance to address your concern first at admin@tuwa.io.

Data we do not collect from you. Some data comes from other sources: transactions and wallet addresses that an app syncs to Quasar Cloud, public blockchain data, and the details of an organization's contact person, which an owner of the organization gives when accepting the Data Processing Addendum. If we obtain your personal data from a source other than you, we will also provide applicable information about its source and the timing of notice (Regulation (EU) 2016/679, Article 14).
